"Environmental health, for a possible future": this is the motto of the “XIV Congress of Environmental Health” organized by the Spanish Society of Environmental Health (SESA), with the collaboration of the Government of Aragon, to be held in Zaragoza, June 23, 2017.

In this Congress, there will be other scientific events as the “IV Ibero-American Congress on Environmental Health”, the “X National Conference on Endocrine Disruptors” and the “1st Conference of the Spanish Association of Aerobiology”.

It’s intended to involve the population of this scientific event. For this, an activity will be organized within the congress in which society (neighborhood groups, movements concerned about some environmental issue, parents’ associations, etc.) have the opportunity to share experiences with experts in environmental health.

It would be addressing those issues that most concern to society but in a remote conflict that usually arise now.

There will be five previous workshops to Congress on:

I. New trends in Legionella’s spanalytical techniques and their implications in public health decision-making
II. Climate Change And Health In Teaching And Research In Ibero-American Universities.
III. Vectorial control. Practical application
IV. Practical Workshop.- Elaboration of a Water Sanitation Plan in small and medium supplies.
V. Environmental Health and Emerging Pollutants

Zaragoza is a city that offers a cozy, noble setting, with history, culture, architecture and the color of a river that enriches its lands.
We hope that the scientific proposal we make will be attractive and we can share enriching experiences.
